                                                                                 metazoan invertebrate organisms, such as insects and worms, or metazoan invertebrate organisms, such as insects and worms, or cultured cells, resulting in p53 expression or mis-expression. The tumour suppressor genes, a p53 polypeptide or genetically modified organisms or cells are used in screening assays to identify compounds or molecules, preferably a pharmaceutical agent or a pesticide, that modulates p53 activity. The genetically modified organisms or cells are also useful for studying p53 activity by detecting the phenotype caused by the expression or mis-expression of the p53 protein in the insect. The method additionally comprises observing a second insect having the same genetic modification as the previous one, which causes the expression or mis-expression of the p53 protein, where the second animal additionally comprises a mutation in a desired gene and differences between the phenotype of the first and second identifies the desired gene as capable of modifying the function of the gene cells are also useful for identifying other genes modulating the tention of, or interaction with the p53 gene.

metazoan invertebrate organisms, such as insects and worms, or cultured cells, resulting in p53 sepression or mis-expression. The tumour suppressor genes, a p53 polypeptide or genetically modified organisms or cells are used in screening assays to identify compounds or molecules, preferably a pharmaceutical agent or a pesticide, that modulates p53 activity. The genetically modified organisms or cells are also useful for studying p53 activity by detecting the phenotype caused by the expression or mis-expression of the p53 protein in the insect. The method additionally comprises observing a second insect having the same genetic modification as the previous one, which causes the expression or mis-expression of the p53 protein, where the second animal additionally comprises a mutation in a desired gene and differences between the phenotype of the first and second identifies the desired gene as capable of modifying the function of the gene cells are also useful for identifying other genes modulating the function of, or interaction with the p53 gene.

The tumour suppressor genes, a p53 polypeptide or genetically modified organisms or cells are used in screening assays to identify compounds or molecules, preferably a pharmaceutical agent or a pesticide, that modulates p53 activity. The genetically modified organisms or cells are also useful for studying p53 activity by detecting the phenotype are also useful for studying response of the p53 protein in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        caused by the expression or mis-expression of the p53 protein in the insect. The method additionally comprises observing a second insect having the same genetic modification as the previous one, which causes the expression or mis-expression of the p53 protein, where the second animal additionally comprises a mutation in a desired gene and differences between the phenotype of the first and second identifies the desired gene as capable of modifying the function of the gene encoding the p53 protein. The genetically modified organisms or cells are also useful for identifying other genes modulating the function of, or interaction with the p53 gene.
